

The Indirect Effect of Import Competition on Corporate Tax Avoidance

Baptiste Souillard

ECARES, SBS-EM, Université Libre de Bruxelles

14th Doctoral Conference in Economics

Ruhr Graduate School in Economics

March 3-4, 2020

Motivation

- Profits are subject to **taxation**.
- To lighten this **burden**, firms adapt how they operate and invest.
- Some **avoid taxes**, i.e., exploit legal technicalities to reduce their tax liability (e.g., loopholes and mismatches).
- Corporate tax avoidance has now become a **major policy concern**.
 - Context: tax scandals, budget deficits, rise of inequalities, covid-19.
 - Profit shifting of multinational corporations \approx \$100b annual loss in tax revenues for the US (Clausing, 2016).

What I do in this paper

- The role played by **competition** is theoretically unclear in the literature (Marrelli and Martina, 1988; Goerke and Runkel, 2011).
- To shed more light on this, I build on 2 distinct strands of research.
 - **Economics**: impact of the China shock → massive shock + quasi-natural experiment (e.g., Autor et al., 2013; Pierce and Schott, 2016).
 - **Accounting**: measurement of corporate tax avoidance (e.g., Hanlon and Heitzman, 2010; De Simone et al., 2019).
- I study the effect of **Chinese import competition** on tax avoidance of **US-listed firms** using their financial statements.

Preview of the results

- The paper documents a **positive** and **causal** effect of import competition on corporate tax avoidance.
- This effect is specific to **multinational enterprises** (MNEs) and passes through **intangible assets**.
 \uparrow import competition \Rightarrow \uparrow intangible assets \Rightarrow \uparrow profit shifting
- Plus, the increase in tax avoidance is a **side effect**: it seems that MNEs invested in intangibles to escape competition in the first place.
- The findings carry **policy implications**.
 - The China shock contributed to the recent decline in the average effective tax rate of US-listed firms (Dyreng et al., 2017).
 - The results help understand the recent backlash against large firms and globalization (Helpman, 2017; Ravallion, 2018; Rodrik, 2018).

Related literature

Corporate tax avoidance

- Growing evidence of profit shifting activities (Beer et al., 2020)

Sources and key variables

Firm-level data and tax avoidance variables

The **firm-level** data come from Compustat.

- It consists of balance sheets, income statements, and cash flows of publicly listed firms in North America since 1950.
- I construct 4 firm-year indicators of corporate tax avoidance:
 - ratio of income taxes to pre-tax income (ETR),
 - ratio of non-deferred income taxes to pre-tax income (ETR2),
 - ratio of cash income taxes paid to pre-tax income (CASHETR),
 - ratio of cash income taxes paid to operating cash flows (CFM).
- They are complementary and the most prevalent in the literature.

► Table

Sources and key variables

Industry-level data and import competition variable

I supplement Compustat data with **industry-level data** at the 4-digit SIC level from the NBER-CES Manufacturing Industry Database and Schott (2008).

- NBER-CES → annual output, employment, etc from 1958 to 2011.
- Schott (2008) → US bilateral trade flows from 1972 to 2005.
- The competition variable is the penetration ratio of US imports from China:

$$IMP_{ijt} = IMP_{jt} = \frac{Imports_{jt}^{China, US}}{Output_{jt}^{US} + Imports_{jt}^{World, US} - Exports_{jt}^{US, World}}$$

Firm i mostly active in sector j in year t .

- This ratio varies both over time and across sectors. ► Example

Sample

Focus on US-listed manufacturing firms between 1990 and 2005

I use a subsample containing only **US-headquartered** firms operating **between 1990 and 2005** in **manufacturing**.

- Headquartered in the US for comparability.
- 1990s: start of the boom of China's exports. [▶ Graph](#)
- 90 percent of China's exports were manufacturing products.

The unbalanced sample includes 5,739 firms operating in 218 industries.

First evidence

Figure 1 – Import competition and corporate tax avoidance: macro-level evidence [► Table](#)

- The positive correlation also holds at the industry-level.

[► Graph](#)

[► Table](#)

- 5 Conclusion

Econometric model

Benchmark specification

I assess the effect of import competition on corporate tax avoidance by regressing:

$$CTA_{ijt} = \beta_0 + \beta_1 IMP_{jt} + \beta_2 X_{ijt} + \alpha_i + \delta_t + \epsilon_{ijt}$$

- *CTA*: corporate tax avoidance variable.
- *IMP*: penetration ratio of US imports from China.
- *X*: vector of control variables (e.g., sales, pre-tax income, tax loss carry forward, assets, profitability, leverage, foreign operations).
- α : firm-level fixed effects.
- δ : year-level fixed effects.

Baseline results

A positive effect of competition on corporate tax avoidance

Table 1 – Effect of import competition on corporate tax avoidance: baseline equation

	(1) ETR_{ijt}	(2) $ETR2_{ijt}$	(3) $CASHETR_{ijt}$	(4) CFM_{ijt}
IMP_{jt}	-0.20 ^a (0.03)	-0.18 ^b (0.07)	-0.18 ^a (0.04)	-0.26 ^a (0.06)
Controls	Yes	Yes	Yes	Yes
Firm FEs	Yes	Yes	Yes	Yes
Year FEs	Yes	Yes	Yes	Yes
R ²	0.20	0.21	0.13	0.12
Nb. of obs.	23,097	22,286	16,688	16,584

Notes. Standard errors, in parentheses, are clustered at the 4-digit 1987 SIC industry. ^d $p < 0.15$, ^c $p < 0.10$, ^b $p < 0.05$, ^a $p < 0.01$.

► Counterfactual exercise

Sensitivity tests

Exclusion of outliers, more controls, model specification, and falsification tests

The effect is

- robust to removing different types of **outliers**: extreme values of the right-hand side variables, firms with negative profits, entries and exits, firms involved in a merger/acquisition operation.
- robust to extending the set of **covariates**: more globalization-related variables, finer sets of fixed effects.
- consistent across **specifications**: 3-digit industry level, 4-year averages, 16-year differences.
- corroborated by **falsification tests**: random industry, pre-period data.

► Table

Endogeneity

Lagged independent variables and IV strategy

- The control variables raise concerns about **reverse causality** and may lead to the “**bad controls**” problem (Angrist and Pischke, 2009).
 - Use lagged right-hand side variables to mitigate these issues. [▶ Table](#)
- Changes in import competition come from both **supply-** and **demand-**side shocks.
 - Need to isolate changes coming from the supply-side.
 - Use the share of imports from China in 8 other high-income countries as an instrument (Autor et al, 2013; Iacovone et al., 2013; Chakraborty and Henry, 2019). [▶ Table](#)
 - The identification relies on 3 (too strong?) assumptions.

Endogeneity

Difference-in-differences approach

- Alternative: exploit the **granting of the PNTR status** to China in 2000.
 - This event is responsible for 1/3 of the growth of US expenditures in Chinese goods between 2000 and 2005 (Handley and Limao, 2017).
 - Treatment: difference between NNTR and NTR tariff rates (sector-specific).
 - The variation mostly comes from NNTR tariff rates (established in 1930).
 - The equation becomes:

$$CTA_{ijt} = \beta_0 + \beta_1 PNTR_{jt} + \beta_2 X_{ijt} + \alpha_i + \delta_t + \epsilon_{ijt}$$

with $PNTR_{jt} = 1_{t \geq 2001} (NNTR_{j1999} - NTR_{j1999})$.

► Table

► Parallel trends + placebo

- Robust to the issue raised by de Chaisemartin and D'Haultfoeuille (2020).

Outline of the talk

- 1 Introduction
- 2 Data
- 3 Causal effect
- 4 Mechanism**
- 5 Conclusion

What is behind this average effect?

Profit shifting of multinational firms via intangible assets

- **MNEs** can a priori avoid taxes more easily than domestic firms: they can artificially **shift profits** towards low-tax countries.
 - Is the average effect driven by MNEs?
 - Yes! ▶ Figure
 - Robust to the definition of an MNE (financial statements vs Exhibit 21 files).
- The use of **intra-firm royalty payments** constitute one of the dominant profit shifting channels (Heckemeyer and Overesch, 2017) + the China shock pushed firms to **innovate** (e.g., Bloom et al., 2016).
 - Indirect effect of competition through intangible assets?
 - Yes! ▶ Table
 - Robust to the definition of an intangible (broad definition or patents).

China shock ⇒ MNEs invested in intangibles ⇒ MNEs shifted more profits

Did MNEs invest in intangibles just to shift more profits?

No, they did it to escape competition in the first place

- If MNEs invested in intangibles principally to shift more profits and save taxes, we would note more **FDIs of MNEs in tax havens** after the shock.
 - ⇒ Did MNEs intensify their network of subsidiaries in tax havens?
 - ⇒ No! ▶ Table
 - Besides, investments in intangibles could help firms upgrade and thereby **escape competition**.
 - ⇒ Is the negative impact of the China shock on sales mitigated by intangibles?
 - ⇒ Yes! ▶ Table
- ⇒ The increase in corporate tax avoidance is a **side effect** of import competition.

Outline of the talk

- 1 Introduction
- 2 Data
- 3 Causal effect
- 4 Mechanism
- 5 Conclusion**

Summary of the paper

- The effect of competition on corporate tax avoidance is an unresolved question in the existing literature.
- This paper attempts to provide answers by investigating the effect of rising Chinese import competition on tax avoidance of US-listed firms.
- The paper documents a **positive**, **causal**, and **statistically robust** effect of trade-induced competition on corporate tax avoidance.
- The China shock prompted **MNEs** to invest in **intangibles** and these assets facilitated their **profit shifting** activities.
- Nonetheless, this effect is **indirect**: these intangibles primarily aimed at alleviating losses, not saving taxes.

Thank you for your attention!

Appendix

Corporate tax avoidance variables

Table 2 – Correlation between tax avoidance variables
(within firms)

	<i>ETR</i>	<i>ETR2</i>	<i>CASHE</i> <i>ETR</i>	<i>CFM</i>
<i>ETR</i>	1.00			
<i>ETR2</i>	0.53	1.00		
<i>CASHE</i> <i>ETR</i>	0.26	0.41	1.00	
<i>CFM</i>	0.20	0.27	0.64	1.00

Notes. This table reports the average Pearson's correlation coefficients between the four tax avoidance variables (within firms). For a firm-year observation to be included in the computation of a correlation coefficient, the two tax avoidance variables must lie in the [0,1] interval.

Import penetration ratio across sectors

- The penetration ratio of Chinese exports to the US of *hardwood* veneer and plywood products (SIC 2435) was 12 percent in 2005, i.e., about twice the average.
- For *softwood* veneer and plywood products (SIC 2436), the import penetration ratio was **40 times smaller** in the same year (0.3 percent).

Baseline results

Figure 4 – Counterfactual analysis with back-of-the-envelope computations

- The average ETR would have been **0.93 percentage point** higher in 2005 if the penetration ratio of US imports from China stayed constant.
- The China shock contributed **17 percent** to the decline in the average ETR observed between 1990 and 2005. [► Back](#)
