# The Indirect Effect of Import Competition on Corporate Tax Avoidance

#### **Baptiste Souillard**

ECARES, SBS-EM, Université Libre de Bruxelles

MaCCI Annual Conference
ZEW – Leibniz Centre for European Economic Research
March 12, 2020

#### Motivation

- Profits are subject to taxation.
- To lighten this financial burden, firms adapt how they operate and invest.
- Some firms avoid taxes, i.e., some firms exploit legal technicalities to reduce their tax liability (e.g., loopholes and mismatches).
- Corporate tax avoidance has now become a major policy concern.
  - Context: tax scandals, budget deficits, rise of inequalities, covid-19.
  - Profit shifting of multinational corporations  $\approx$  \$100b annual loss in tax revenues in the US (Clausing, 2016).

#### What I do in this paper

- The role played by **competition** is theoretically unclear in the literature (Marrelli and Martina, 1988; Goerke and Runkel, 2011).
- To shed more light on this, I build on 2 distinct strands of research.
  - Economics: impact of the China shock → massive shock + quasi-natural experiment (e.g., Autor et al., 2013; Pierce and Schott, 2016).
  - Accounting: measurement of corporate tax avoidance (e.g., Hanlon and Heitzman, 2010; De Simone et al., 2019).
- I study the effect of **Chinese import competition** on tax avoidance of **US-listed firms** using rich data on their financial statements.

#### Preview of the results

- The paper documents a positive and causal effect of import competition on corporate tax avoidance.
- This effect is specific to multinational enterprises (MNEs) and passes through intangible assets.

```
\uparrow import competition \Rightarrow \uparrow intangible assets \Rightarrow \uparrow profit shifting
```

- Plus, the increase in tax avoidance is a side effect: MNEs invested in intangibles to escape competition in the first place.
- The findings carry policy implications.
  - The China shock contributed to the recent decline in the average effective tax rate of US-listed firms (Dyreng et al., 2017).
  - The results help understand the recent backlash against large firms and globalization (Helpman, 2017; Rodrik, 2018; Walter, 2021).

#### Related literature

#### Corporate tax avoidance

- Growing evidence of profit shifting activities (Beer et al., 2020)
  - Channels: e.g., Egger et al. (2010), Griffith et al. (2014), Alstadsaeter et al. (2018), Davies et al. (2018), Laffitte and Toubal (2019).
  - Macro estimates: e.g., Crivelli et al. (2016), Clausing (2016), Cobham and Jansky (2018), Tørsløv et al. (2018), Laffitte et al. (2020).
- Determinants of tax dodging (Alm et al., 2019; Wang et al., 2020)
  - Internal drivers: e.g., Desai and Dharmapala (2009), McGuire et al. (2014), Higgins et al. (2015), Khan et al. (2017), Souillard (2020).
  - External factors: e.g., Marrelli and Martina (1988), Goerke and Runkel (2011), Hoopes et al. (2012), Dyreng et al. (2016), Edwards et al. (2016), Tian et al. (2016), Cen et al. (2017).

#### China shock

- Labor markets: e.g., Autor et al. (2013), Mion and Zhu (2013), Utar and Ruiz (2013), Utar (2014), Acemoglu et al. (2016), Pierce and Schott (2016).
- Firm behavior: e.g., lacovone et al. (2013), Bloom et al. (2016), Hombert and Matray (2018), Chakraborty and Henry (2019), Amiti et al. (2020).

## Sources and key variables

Firm-level data and tax avoidance variables

#### The firm-level data come from Compustat.

- It consists of balance sheets, income statements, and cash flows of publicly listed firms in North America since 1950.
- I construct 4 firm-year indicators of corporate tax avoidance:
  - ratio of income taxes to pre-tax income (ETR),
  - ratio of non-deferred income taxes to pre-tax income (ETR2),
  - ratio of cash income taxes paid to pre-tax income (CASHETR),
  - ratio of cash income taxes paid to operating cash flows (CFM).
- They are complementary and the most prevalent in the literature.

## Sources and key variables

Industry-level data and import competition variable

I supplement Compustat data with **industry-level data** at the 4-digit SIC level from the NBER-CES Manufacturing Industry Database and Schott (2008).

- NBER-CES  $\rightarrow$  annual output, employment, etc from 1958 to 2011.
- Schott (2008)  $\rightarrow$  US bilateral trade flows from 1972 to 2005.
- The competition variable is the penetration ratio of US imports from China:

$$IMP_{ijt} = IMP_{jt} = \frac{Imports_{jt}^{China,US}}{Output_{jt}^{US} + Imports_{jt}^{World,US} - Exports_{jt}^{US,World}}$$

Firm i mostly active in sector j in year t.

This ratio varies both over time and across sectors.

#### Sample

Focus on US-listed manufacturing firms between 1990 and 2005

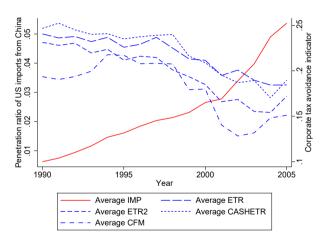

I use a subsample containing only **US-headquartered** firms operating **between 1990 and 2005** in **manufacturing**.

- Headquartered in the US for comparability.
- 1990s: start of the boom of China's exports. → Graph
- 90 percent of China's exports were manufacturing products.

The unbalanced sample includes 5,739 firms operating in 218 industries.

#### First evidence

Figure 1 – Import competition and corporate tax avoidance: macro-level evidence Table

• The positive correlation also holds at the industry-level. • Graph • Table

#### Outline of the talk

- 1 Introduction
- 2 Data
- 3 Causal effect
- 4 Mechanism
- Conclusion

#### Econometric model

Benchmark specification

I assess the effect of import competition on corporate tax avoidance by regressing:

$$CTA_{ijt} = \beta_0 + \beta_1 IMP_{jt} + \beta_2 X_{ijt} + \alpha_i + \delta_t + \epsilon_{ijt}$$

- CTA: corporate tax avoidance variable.
- IMP: penetration ratio of US imports from China.
- X: vector of control variables (e.g., sales, pre-tax income, tax loss carry forward, assets, profitability, leverage, foreign operations).
- $\alpha$ : firm-level fixed effects.
- $\delta$ : year-level fixed effects.

#### Baseline results

A positive effect of competition on corporate tax avoidance

*Notes.* Standard errors, in parentheses, are clustered at the 4-digit 1987 SIC industry.  $^dp < 0.15$ ,  $^cp < 0.10$ ,  $^bp < 0.05$ ,  $^ap < 0.01$ .

<sup>►</sup> Counterfactual exercise

#### Sensitivity tests

Exclusion of outliers, more controls, model specification, and falsification tests

#### The effect is

- robust to removing different types of **outliers**: extreme values of the right-hand side variables, firms with negative profits, entries and exits, firms involved in a merger/acquisition operation.
- robust to extending the set of covariates: more globalization-related variables, finer sets of fixed effects.
- consistent across **specifications**: 3-digit industry level, 4-year averages, 16-year differences.
- corroborated by **falsification tests**: random industry, pre-period data.

#### **Endogeneity**

Lagged independent variables and IV strategy

- The control variables raise concerns about reverse causality and may lead to the "bad controls" problem (Angrist and Pischke, 2009).
  - → Use lagged right-hand side variables to mitigate these issues. Table
- Changes in import competition come from both supply- and demand-side shocks.
  - → Need to isolate changes coming from the supply-side.

  - $\rightarrow$  The identification relies on 3 (too strong?) assumptions.

## Endogeneity

Difference-in-differences approach

- Alternative: exploit the granting of PNTR status to China in 2000.
  - → This event is responsible for 1/3 of the growth of US expenditures in Chinese goods between 2000 and 2005 (Handley and Limao, 2017).
  - → Treatment: difference between NNTR and NTR tariff rates (sector-specific).
  - ightarrow The variation mostly comes from NNTR tariff rates (established in 1930).
  - $\rightarrow$  The equation becomes:

$$CTA_{ijt} = \beta_0 + \beta_1 PNTR_{jt} + \beta_2 X_{ijt} + \alpha_i + \delta_t + \epsilon_{ijt}$$

with 
$$PNTR_{jt}=1_{t\geq 2001}$$
 ( $NNTR_{j1999}-NTR_{j1999}$ ).  $ightharpoonup$  Table  $ightharpoonup$  Parallel trends + placebo

 $\rightarrow$  Robust to the issue raised by de Chaisemartin and D'Haultfoeuille (2020).

#### Outline of the talk

- 1 Introduction
- 2 Data
- Causal effect
- 4 Mechanism
- Conclusion

## What is behind this average effect?

Profit shifting of multinational firms via intangible assets

- MNEs have greater possibilities for dodging taxes: They can artifically shift profits toward low-tax countries.
  - → Is the average effect driven by MNEs?
  - → Yes! ► Figure
  - → Robust to the definition of an MNE (financial statements vs Exhibit 21 files).
- The strategic use of intra-firm royalty payments constitutes one of the dominant profit shifting channels (Heckemeyer and Overesch, 2017) + the China shock pushed firms to innovate (e.g., Bloom et al., 2016).
  - → Indirect effect of competition through intangible assets?
  - → Yes! → Table
  - → Robust to the definition of an intangible (broad definition or patents).

China shock  $\Rightarrow$  MNEs invested in intangibles  $\Rightarrow$  MNEs shifted more profits

#### Did MNEs invest in intangibles just to shift more profits?

No, they did it to escape competition in the first place

- If MNEs invested in intangibles principally to shift more profits and save taxes, we would note
  more FDIs of MNEs in tax havens after the shock.
  - ⇒ Did MNEs intensify their network of subsidiaries in tax havens?
  - No! ► Table
- Besides, investments in intangibles could help firms upgrade and thereby **escape competition**.
  - ⇒ Is the negative impact of the China shock on sales mitigated by intangibles?
  - → Yes! → Table
- ⇒ The increase in corporate tax avoidance is a **side effect** of import competition.

#### Outline of the talk

- 1 Introduction
- 2 Data
- Causal effect
- 4 Mechanism
- **6** Conclusion

## Summary of the paper

- The effect of competition on corporate tax avoidance is an unresolved question in the existing literature.
- This paper attempts to provide answers by investigating the effect of rising Chinese import competition on tax avoidance of US-listed firms.
- The paper documents a **positive**, **causal**, and **statistically robust** effect of trade-induced competition on corporate tax avoidance.
- The China shock prompted MNEs to invest in intangibles, and these assets facilitated their profit shifting activities.
- This effect is truly indirect: These intangibles primarily aimed at alleviating losses, not saving taxes.

## **Appendix**

## Corporate tax avoidance variables

Table 2 – Correlation between tax avoidance variables (within firms)

	ETR	ETR2	CASHET	R CFM
ETR	1.00			
ETR2	0.53	1.00		
CASHETR	0.26	0.41	1.00	
CFM	0.20	0.27	0.64	1.00

Notes. This table reports the average Pearson's correlation coefficients between the four tax avoidance variables (within firms). For a firm-year observation to be included in the computation of a correlation coefficient, the two tax avoidance variables must lie in the [0,1] interval.

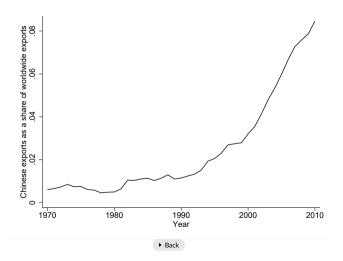

#### Import penetration ratio across sectors

- The penetration ratio of Chinese exports to the US of *hardwood* veneer and plywood products (SIC 2435) was 12 percent in 2005, i.e., about twice the average.
- For *softwood* veneer and plywood products (SIC 2436), the import penetration ratio was **40 times smaller** in the same year (0.3 percent).

## China's exports

#### Baseline results

Figure 4 - Counterfactual analysis with back-of-the-envelope computations

- The average ETR would have been **0.93 percentage point** higher in 2005 had the penetration ratio of US imports from China stayed constant.
- The China shock contributed 17 percent to the decline in the average ETR observed between 1990 and 2005.
